Reflect on your Course 5 project

The fifth end-of-course project required skills for working with more complex data relationships. These skills included regression models and evaluation techniques to help interpret and articulate relationships in datasets.
In this project, you were given the opportunity to build a regression model based on a given dataset and confirm the selection of your variables.
For this discussion prompt, consider the following:

Discuss the aspects of regression modeling that you found to be the most useful as you worked on this project.
How has your understanding of hypothesis tests expanded through the practice in this project?
What's an interesting element of regression analysis you discovered during this course that you were unaware of previously?
