Reflect on your Course 2 project

In your second end-of-course project, you continued in your role as a data analyst. Within each of the available scenarios, you were given the opportunity to use Python to load, explore, and organize data.
For this discussion prompt, consider the following:

Which features or tools of the Python programming language did you find to be the most useful as you were working on this project?
How did using the Python programming language help you learn more about your data?
What's an element of Python and/or the data analysis process you discovered for the first time during this project?
